THE PLAN
OF MY
HOUSE

DRAWING THE PLAN OF MY HOUSE

Your house is the place where you feel comfortable and safe. It is also the place you spend more time of your life, and because of that, you know it so well. You know every corner of the house, every position of the furnitures and objects, but, if I ask you to draw it... would you be able to do it?
Let's see how we can manage to do so.

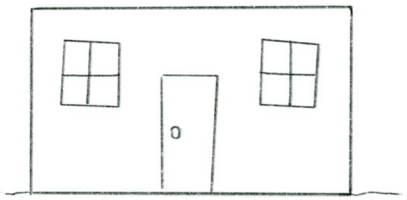

FOLLOW ME WITH THESE STEPS

STEP 1

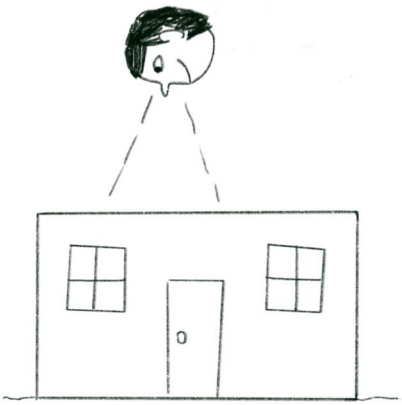

The first thing is to know how we have to look at the house to be able to draw it.

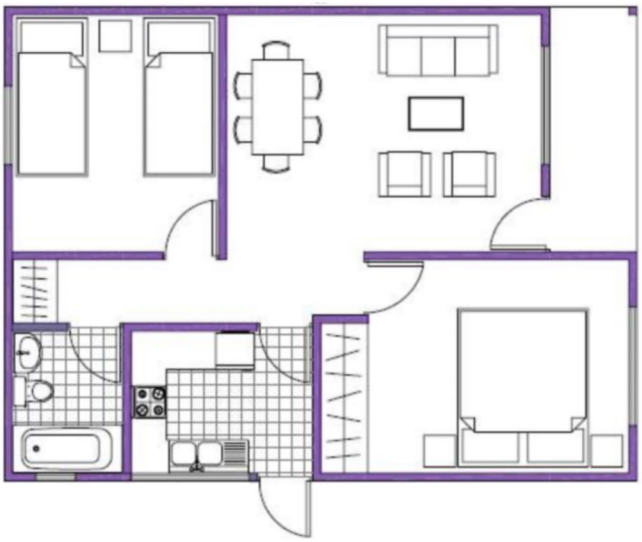

Imagine this is your house from the outside.

Imagine now we take the roof out!

Finally, imagine that you are flying over your house with no roof and look down.
What do you see?

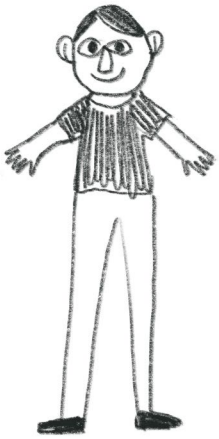

You would probably see something like this drawing.

This is called "house plan", it is a drawing where we can see the distribution of all parts of the house (bedrooms, kitchen, living room, bathrooms, doors, windows...) and how they are connected.

STEP 2

It is really important when we draw a plan to keep the proportions.
The ***proportion*** is the relation of size and quantity that the parts of something keep between each other.
I know, this is a bit confusing.
Let's see some example to understand it better.

Example #1

In this drawing, the legs *are not in proportion* with the rest of the body

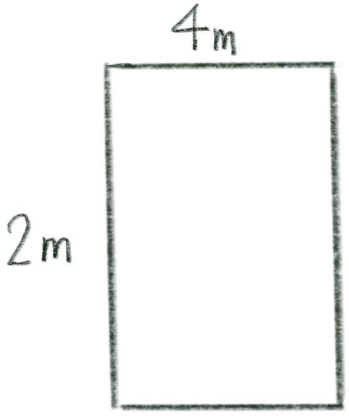

In this one, the arms *are not in proportion* with the rest of the body.

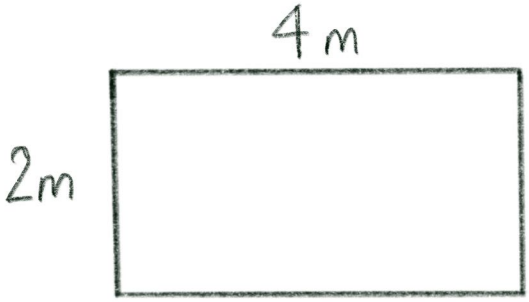

But in this one, arms and legs *are in proportion* with the rest of the body.

Example #2

We have a rectangle (can be a room in the house) that has the dimensions of 2m x 4m and we want to draw that in proportion.

In this drawing, the side of 2m is bigger than the side of 4m.
*Here, the numbers and the rectangle **are not** in proportion.*

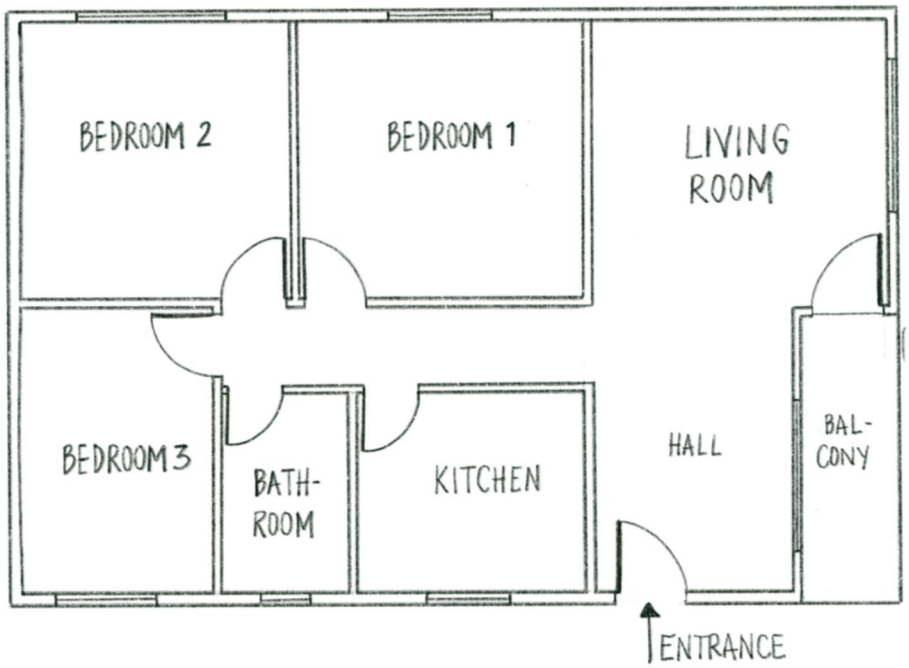

In this one, instead, the side of 4m is bigger than the side of 2m. We know that 4 is double than 2.
*Here, the numbers and the rectangle **are** in proportion.*

STEP 3

Can be a good idea start drawing the plan of your bedroom.

Then keep going with every room in separate papers.
At the end, with scissors, you just cut out every room you drew and put them together as a puzzle to build the whole house plan.

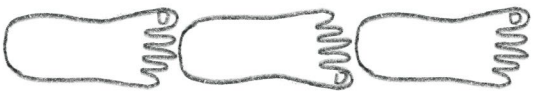

To take the measurements.

To take measurements requires attention and concentration because you are counting and reading numbers.
You will need to write down every number as soon as you take it, so take a pencil and a paper with you!!

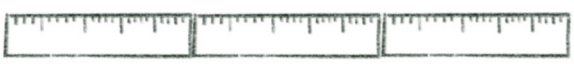

Option 1: Ask for a measuring tape.
You can extend it by the floor all along the length of the walls.

Option 2: Use your feet.
Walking foot by foot all the way from one wall to the other counting how many of them you needed.

Option 3: Use a ruler.
The same system that the feet.

With any of this 3 options you will get the length of all the walls so you can ***apply the right proportions into your drawing.***

STEP 4

Once we have the plan with all the pieces together, it is time to start drawing the inside: beds, sofa, tables, rugs, kitchen and bathroom furnitures, plants, objects or even people.

To finish the house plan, you can color it using color pencils, markers, crayons or watercolor.
Or maybe you prefer to leave it in black and white... that is up to you.

Here I leave some examples of colored house plans to help you to make an idea about how they can look like. ***Have fun!***
